Regex Example
The Dragon

Delivering Quality since December 31, 1997 Release of Python 1.5

- Deprecated old module 'regex', based on Perl-style patterns.
- 'regex' finally removed in Python 2.5 (September 19, 2006)

Origins re module Do I need it? Features Regex Example The Dragon

Answer for questions:

Origins re module Do I need it? Features Regex Example The Dragon

Answer for questions:

- "Does this string match the pattern?"
- "Is there a match for the pattern anywhere in this string?"

Answer for questions:

- "Does this string match the pattern?"
- "Is there a match for the pattern anywhere in this string?"
- Replace part of it
- Split into pieces

Origins re module Do I need it? Features Regex Example The Dragon

re is handled as string - there is no special syntax for expressing it (advantage and disadvantage)

Origins re module Do I need it? Features Regex Example The Dragon

re is handled as string - there is no special syntax for expressing it (advantage and disadvantage) re patterns are compiled into bytecode

Origins re module Do I need it? Features Regex Example The Dragon

re is handled as string - there is no special syntax for expressing it (advantage and disadvantage) re patterns are compiled into bytecode re module is a C extension module (like socket or zlib)

re is handled as string - there is no special syntax for expressing it (advantage and disadvantage) re patterns are compiled into bytecode re module is a C extension module (like socket or zlib) re language is relatively small and restricted

- not all possible string processing tasks can be done
- some of them can be done, but expression would be very complicated

Backslash - escape metacharacters
"Backslash Plague" problem

- matches a
- matches abcbd to the end of the string
- fails, because current position is the end of the string, so cannot match b
- matches abcb one less character
- fails, because current position is d, so cannot match b
- matches abc, so [bcd] * matches only bc
- abcb, tries last character b, and it's on current position

```
re.match("a[bcd]*b", "abcbd")
```

- matches a
- matches abcbd to the end of the string
- fails, because current position is the end of the string, so cannot match b
- matches abcb one less character
- fails, because current position is d, so cannot match b
- matches abc, so [bcd] * matches only bc
- abcb, tries last character b, and it's on current position
- success

```
>>> re.findall('a[bcd]*b', 'abcbd')
['abcb']
```

pytest-raisesregexp 2.0	7	Simple pytest plugin to look for regex in Exceptions	
QRegexEditor 0.5.1	7	PvQt regex editor	
range-regex 1.0.4	7	Python numeric range regular expression generator	
regex2dfa 0.1.9	7	regex2dfa	
regexdict 0.0.1	7	Regex Dict	
RegexTester 0.5	7	Python online regex tester for Python 2.7+	
boost regex 0.57	6	Very basic interface to the boost regex library.	

PyPI re2 re2 by Facebook re2 by Axiak Why re2?

Wrapper for Google RE2 engine Prerequisites for re2 in Python:

- RE2 library from Google
- Python development headers
- ullet build environment with g++

Released in April 2015. In development since 2010. Features

• fullmatch works like match but anchors the match at both the start and the end

 test_(search|match|fullmatch) methods that work like (search|match|fullmatch) but only returns True or False

Missing Features

- no substitution methods
- no flags
- no split, findall, finditer
- no top-level functions like search or match; just use compile
- no compile cache
- no lastindex or lastgroup on Match objects

Initially fork of Facebook version, later rewritten from scratch. Features

Backward compatibility

```
try:
    import re2 as re
except ImportError:
    import re
```

re2 will automatically fall back to the original re module if there is a regex that it cannot handle: re2 doesn't handle lookahead assertions (?=...).

PyPI re2 re2 by Facebook re2 by Axiak Why re2?

Missing Features/Flaws

• Unicode support: module supports UTF8, so automatically encodes and decodes any unicode string.

PyPI re2 re2 by Facebook re2 by Axiak Why re2?

Total runs: 100

Test	re time (s)	re2 time (s)	% time
Findall URI or Emails	348.380	8.139	2.34%
Replace wikilinks	3.659	0.812	22.19%
Remove wikilinks	3.553	0.273	7.70%

>>> verbose_regex.findall(numbers)
['127.2', '15.30', '73']
>>>
```

re.LOCALE, re.L

Make \wnote{w} , \wnote{w} , $\ensuremath{\normalfont{b}}$, and $\ensuremath{\normalfont{B}}$, dependent on the current locale instead of the Unicode database.

Do not use.

Deprecated in Python 3.5, will be removed in version 3.6
